

LDO Linear Voltage Regulator - Ultra-Low Quiescent Current, Ultra-Low Noise

200 mA

NCV8702

The NCV8702 is a low noise, low power consumption and low dropout Linear Voltage Regulator. With its excellent noise and PSRR specifications, the device is ideal for use in products utilizing RF receivers, imaging sensors, audio processors or any component requiring an extremely clean power supply. The NCV8702 uses an innovative Adaptive Ground Current circuit to ensure ultra low ground current during light load conditions.

Features

- Operating Input Voltage Range: 2.0 V to 5.5 V
- Available in Fixed Voltage Options: 0.8 to 3.5 V in 2.5 mV steps
Contact Factory for Other Voltage Options
- Ultra-Low Quiescent Current of Typ. 10 μ A
- Ultra-Low Noise: 11 μ V_{RMS} from 100 Hz to 100 kHz
- Very Low Dropout: 140 mV Typical at 200 mA
- $\pm 2\%$ Accuracy Over Full Load/Line/Temperature
- High PSRR: 68 dB at 1 kHz
- Thermal Shutdown and Current Limit Protections
- Internal Soft-Start to Limit the Turn-On Inrush Current
- Stable with a 1 μ F Ceramic Output Capacitor
- Available in TSOP-5 and XDFN 1.5 x 1.5 mm Package
- Active Output Discharge for Fast Output Turn-Off
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free and are RoHS Compliant

Typical Applications

- Satellite Radio Receivers, GPS
- Rear View Camera, Electronic Mirrors, Lane Change Detectors
- Portable Entertainment Systems
- Other Battery Powered Applications

ORDERING INFORMATION

See detailed ordering and shipping information on page 18 of this data sheet.

NCV8702

Figure 2. Simplified Schematic Block Diagram

Table 1. PIN FUNCTION DESCRIPTION

Pin No. XDFN 6	Pin No. TSOP-5	Pin Name	Description
1	5	OUT	Regulated output voltage pin. A small 1 μ F ceramic capacitor is needed from this pin to ground to assure stability.
2	4	N/C	Not connected. This pin can be tied to ground to improve thermal dissipation.
3	2	GND	Power supply ground.
4	3	EN	Driving EN over 0.9 V turns on the regulator. Driving EN below 0.4 V puts the regulator into shutdown mode.
5		N/C	Not connected. This pin can be tied to ground to improve thermal dissipation.
6	1	IN	Input pin. It is recommended to connect a 1 μ F ceramic capacitor close to the device pin.

Table 2. ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage (Note 1)	V_{IN}	-0.3 V to 6 V	V
Output Voltage	V_{OUT}	-0.3 V to $V_{IN} + 0.3$ V	V
Enable Input	V_{EN}	-0.3 V to $V_{IN} + 0.3$ V	V
Output Short Circuit Duration	t_{SC}	Indefinite	s
Maximum Junction Temperature	$T_{J(MAX)}$	125	$^{\circ}$ C
Storage Temperature	T_{STG}	-55 to 150	$^{\circ}$ C
ESD Capability, Human Body Model (Note 2)	ESD _{HBM}	2000	V
ESD Capability, Machine Model (Note 2)	ESD _{MM}	200	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
- This device series incorporates ESD protection and is tested by the following methods:
 ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)
 ESD Machine Model tested per AEC-Q100-003 (EIA/JESD22-A115)
 Latchup Current Maximum Rating tested per JEDEC standard: JESD78.

Table 3. THERMAL CHARACTERISTICS (Note 3)

Rating	Symbol	Value	Unit

Thermal Shutdown Hysteresis	Temperature falling from T _{SD}	T _{SDH}	-	20	-	°C

4. Performance guaranteed over the indicated operating temperature range by design and/or characterization. Production tested at T_J = T_A = 25°C. Low duty cycle pulse techniques are used during testing to maintain the junction temperature as close to ambient as possible.
5. Characterized when V_{OUT} falls 100 mV below the regulated voltage at V_{IN} = V_{OUT(NOM)} + 0.3 V.
6. Shutdown Current is the current flowing into the IN pin when the device is in the disable state.
7. Turn-On time is measured from the assertion of EN pin to the point when the output voltage reaches 0.98 V_{OUT(NOM)}.
8. Guaranteed by design.

APPLICATIONS INFORMATION

General

The NCV8702 is a high performance 200 mA Low Dropout Linear Regulator. This device delivers excellent noise and dynamic performance.

Thanks to its adaptive ground current feature the device consumes only 10 μ A of quiescent current at no-load condition.

The regulator features ultra-low noise of 11 μ V_{RMS}, PSRR of 68 dB at 1 kHz and very good load/line transient performance. Such excellent dynamic parameters and small package size make the device an ideal choice for powering the precision analog and noise sensitive circuitry in portable applications. The LDO achieves this ultra low noise level output without the need for a noise bypass capacitor.

A logic EN input provides ON/OFF control of the output voltage. When the EN is low the device consumes as low as typ. 10 nA from the IN pin.

The LDO achieves ultra-low output voltage noise without the need for additional noise bypass capacitor.

The device is fully protected in case of output overload, output short circuit condition and overheating, assuring a very robust design.

Input Capacitor Selection (C_{IN})

It is recommended to connect a minimum of 1 μ F Ceramic X5R or X7R capacitor close to the IN pin of the device. This capacitor will provide a low impedance path for unwanted AC signals or noise modulated onto constant input voltage.

There is no requirement for the min./max. ESR of the input capacitor but it is recommended to use ceramic capacitors for their low ESR and ESL. A good input

capacitor will limit the influence of input trace inductance and source resistance during sudden load current changes.

Larger input capacitor may be necessary if fast and large load transients are encountered in the application.

Output Decoupling (C_{OUT})

The NCV8702 is designed to be stable with a small 1.0 μ F ceramic capacitor on the output. To assure proper operation it is strongly recommended to use min. 1.0 μ F capacitor with the initial tolerance of $\pm 10\%$, made of X7R or X5R dielectric material types.

There is no requirement for the minimum value of Equivalent Series Resistance (ESR) for the C_{OUT} but the maximum value of ESR should be less than 700 m Ω .

Larger output capacitors could be used to improve the load transient response or high frequency PSRR as shown in typical characteristics. The initial tolerance requirements can be wider than $\pm 10\%$ when using capacitors larger than 1 μ F.

It is not recommended to use tantalum capacitors on the output due to their large ESR. The equivalent series resistance of tantalum capacitors is also strongly dependent on the temperature, increasing at low temperature. The tantalum capacitors are generally more costly than ceramic capacitors.

The table on this page lists the capacitors which were used during the IC evaluation.

No-load Operation

The regulator remains stable and regulates the output voltage properly within the $\pm 2\%$ tolerance limits even with no external load applied to the output.

Figure 61. Typical Applications Schematics

LIST OF RECOMMENDED CAPACITORS:

Symbol	Manufacturer	Part Number	Description
C1, C2	Kemet	C0402C105K8PACTU	1 μ F Ceramic $\pm 10\%$, 10 V, 0402, X5R
	TDK	C1005X5R1A105K	- -
	Murata	GRM155R61A105KE15D	- -
	AVX	0402ZD105KAT2A	- -
	Multicomp	MCCA000571	1 μ F Ceramic $\pm 10\%$, 50 V, 1206, X7R
	Panason – ECG	ECJ-0EB0J475M	4.7 μ F Ceramic $\pm 20\%$, 6.3 V, 0402, X5R

APPLICATIONS INFORMATION

Enable Operation

The NCV8702 uses the EN pin to enable/disable its output and to deactivate/activate the active discharge function.

If the EN pin voltage is <0.4 V the device is guaranteed to be disabled. The pass transistor is turned-off so that there is virtually no current flow between the IN and OUT. The active discharge transistor is active so that the output voltage V_{OUT} is pulled to GND through a 1 k Ω resistor. In the disable state the device consumes as low as typ. 10 nA from the V_{IN} .

If the EN pin voltage >0.9 V the device is guaranteed to be enabled. The NCV8702 regulates the output voltage and the active discharge transistor is turned-off.

The EN pin has internal pull-down current source with typ. value of 110 nA which assures that the device is turned-off when the EN pin is not connected. A built-in 2 mV of hysteresis in the EN prevents from periodic on/off oscillations that can occur due to noise.

In the case where the EN function isn't required the EN pin should be tied directly to IN.

Undervoltage Lockout

The internal UVLO circuitry assures that the device becomes disabled when the V_{IN} falls below typ. 1.5 V. When the V_{IN} voltage ramps-up the NCV8702 becomes enabled, if V_{IN} rises above typ. 1.6 V. The 100 mV hysteresis prevents on/off oscillations that can occur due to noise on V_{IN} line.

Reverse Current

The PMOS pass transistor has an inherent body diode which will be forward biased in the case that $V_{OUT} > V_{IN}$. Due to this fact in cases where the extended reverse current condition is anticipated the device may require additional external protection.

Output Current Limit

Output Current is internally limited within the IC to a typical 380 mA. The NCV8702 will source this amount of

current measured with the output voltage 100 mV lower than the nominal V_{OUT} . If the Output Voltage is directly shorted to ground ($V_{OUT} = 0$ V), the short circuit protection will limit the output current to 390 mA (typ). The current limit and short circuit protection will work properly up to $V_{IN} = 5.5$ V at $T_A = 25^\circ\text{C}$. There is no limitation for the short circuit duration.

Thermal Shutdown

When the die temperature exceeds the Thermal Shutdown threshold ($T_{SD} - 160^\circ\text{C}$ typical), Thermal Shutdown event is detected and the device is disabled. The IC will remain in this state until the die temperature decreases below the Thermal Shutdown Reset threshold ($T_{SDU} - 140^\circ\text{C}$ typical). Once the IC temperature falls below the 140°C the LDO is enabled again. The thermal shutdown feature provides protection from a catastrophic device failure due to accidental overheating. This protection is not intended to be used as a substitute for proper heat sinking.

Power Dissipation

As power dissipated in the NCV8702 increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part.

The maximum power dissipation the NCV8702 can handle is given by:

$$P_{D(MAX)} = \frac{[T_{J(MAX)} - T_A]}{\theta_{JA}} \quad (\text{eq. 1})$$

The power dissipated by the NCV8702 for given application conditions can be calculated from the following equations:

$$P_D \approx V_{IN}(I_{GND@I_{OUT}}) + I_{OUT}(V_{IN} - V_{OUT}) \quad (\text{eq. 2})$$

Figure 62. θ_{JA} and $P_{D(MAX)}$ vs. Copper Area (TSOP5)

Figure 63. θ_{JA} and $P_{D(MAX)}$ vs. Copper Area (XDFN6)

Load Regulation

The NCV8702 features very good load regulation of maximum 2.6 mV in the 0 mA to 200 mA range. In order to achieve this very good load regulation a special attention to PCB design is necessary. The trace resistance from the OUT pin to the point of load can easily approach 100 mΩ which will cause a 20 mV voltage drop at full load current, deteriorating the excellent load regulation.

Line Regulation

The IC features very good line regulation of 0.44 mV/V measured from $V_{IN} = V_{OUT} + 0.3$ V to 5.5 V. For battery operated applications it may be important that the line regulation from $V_{IN} = V_{OUT} + 0.3$ V up to 4.5 V is only 0.29 mV/V.

Power Supply Rejection Ratio

The NCV8702 features very good Power Supply Rejection ratio. If desired the PSRR at higher frequencies in the range 100 kHz – 10 MHz can be tuned by the selection of C_{OUT} capacitor and proper PCB layout.

Output Noise

The IC is designed for ultra-low noise output voltage. Figures 3 – 8 illustrate the noise performance for different V_{OUT} , I_{OUT} , C_{OUT} . Generally the noise performance in the indicated frequency range improves with increasing output current, although even at $I_{OUT} = 1$ mA the noise levels are below 22 μV_{RMS} .

Turn-On Time

The turn-on time is defined as the time period from EN assertion to the point in which V_{OUT} will reach 98% of its nominal value. This time is dependent on $V_{OUT(NOM)}$, C_{OUT} , T_A . The turn-on time temperature dependence is shown below:

Figure 64. Turn-On Time vs. Temperature

Internal Soft-Start

The Internal Soft-Start circuitry will limit the inrush current during the LDO turn-on phase. Please refer to Figure 43 for typical inrush current values for given output capacitance.

The soft-start function prevents from any output voltage overshoots and assures monotonic ramp-up of the output voltage.

PCB Layout Recommendations

To obtain good transient performance and good regulation characteristics place C_{IN} and C_{OUT} capacitors close to the device pins and make the PCB traces wide. In order to minimize the solution size use 0402 capacitors. Larger copper area connected to the pins will also improve the device thermal resistance. The actual power dissipation can be calculated by the formula given in Equation 2.

9. Products processed after October 1, 2022 are shipped with quantity 5000 units / tape & reel.

TSOP-5 3.00x1.50x0.95, 0.95P
CASE 483
ISSUE P

DATE 01 APR 2024

SCALE 2:1

GENERIC
MARKING DIAGRAM*

Analog

Discrete/Logic

XXX = Specific Device Code XXX = Specific Device Code
A = Assembly Location M = Date Code
Y = Year ■ = Pb-Free Package
W = Work Week
■ = Pb-Free Package

(Note: Microdot may be in either location)

*This information is generic. Please refer to device data sheet for actual part marking. Pb-Free indicator, "G" or microdot "■", may or may not be present. Some products may not follow the Generic Marking.

NOTES:

1. DIMENSIONING AND TOLERANCING CONFORM TO ASME Y14.5-2018.
2. ALL DIMENSION ARE IN MILLIMETERS (ANGLES IN DEGREES).
3. MAXIMUM LEAD THICKNESS INCLUDES LEAD FINISH THICKNESS. MINIMUM LEAD THICKNESS IS THE MINIMUM THICKNESS OF BASE MATERIAL.
4. DIMENSIONS D AND E1 DO NOT INCLUDE MOLD FLASH, PROTRUSIONS OF GATE BURRS. MOLD FLASH, PROTRUSIONS, OR GATE BURRS SHALL NOT EXCEED 0.15 PER SIDE. DIMENSION D.
5. OPTIONAL CONSTRUCTION: AN ADDITIONAL TRIMMED LEAD IS ALLOWED IN THIS LOCATION. TRIMMED LEAD NOT TO EXTEND MORE THAN 0.2 FROM BODY.

DIM	MILLIMETERS		
	MIN.	NOM.	MAX.
A	0.900	1.000	1.100
A1	0.010	0.055	0.100
A2	0.950 REF.		
b	0.250	0.375	0.500
c	0.100	0.180	0.260
D	2.850	3.000	3.150
E	2.500	2.750	3.000
E1	1.350	1.500	1.650
e	0.950 BSC		
L	0.200	0.400	0.600
θ	0°	5°	10°

RECOMMENDED MOUNTING FOOTPRINT*
